Sequences ADG90460-ADG90539 represent phosphorothioate targeted to the CC human talin gene, which inhibit its expression. The antisense were designed to target different regions of human talin RNA, and were CC analysed for their effect on talin expression by quantitative real-time PCR. Talin is a cytoplasmic protein which links cytoskeletal proteins CC such as actin, myosin and vinculin to integrins, thereby linking the CC extracellular matrix to other cells. It is thought to be involved in the CC expressed in platelets, and may play a role in platelet adhesion as its cubcallular distribution differs between resting non-adhesive platelets CC and activated adhesive platelets. It could also play a major role in CC determining muscle strength and cardiac function as it has been found to participate in the transmission of contractile force to the extracellular cc matrix in cardiomyocytes, and exhibits mechanical loading-dependent cc expression at myotendinous junctions. The expression of talin is contribute to the development of prostate cancer. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of talin crelated disorders, such as those related to cellular adhesion. The CC contribute to the development of prostate cancer. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of talin crelated disorders, such as those related to cellular adhesion. The CC contribute to the development of prostate cancer. The oligonucleotides of the invention are as homen c-Ha-ras phosphorothicate antisense coligonucleotide concentration for a particular cell line.

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human checkpoint kinase 2 (CHKZ). The antisense compound specifically hybridises with and inhibits the expression of human CHK2. The antisense compounds are useful as research reagents and diagnostics, in distinguishing between functions of various members of a biological pathway, and in the treatment of a disease or disorder, which can be treated by modulating the expression of CHK2. This sequence represents a phosphorothioate oligonucleotide used in the scope of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and research reagent and kits. (I) is useful prophylactically prevent or delay infection, inflammation or tumour formation. The present sequence represent a mouse caspase 7 inhibiting chimeric phosphorothicate oligonucleotide having 2'.MOE wings and a deoxy gap, which is used in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase (I) has antiinflammatory and cytostatic activities, and can be used antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sarthy A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     17-DEC-2001; 2001WO-US048966.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ភពពេលពេល XX
The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by creombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a PCR primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on the patent of the fivence of the properties.
                                                           Novel antisense compounds targeted for modulating gene expression and expression of caspase 7 in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antisense therapy; caspase 7 inhibitor; inflammatory condition; hyperproliferative disorder; cancer; bone metabolism; infection; cholesterol disorder; inflammation; tumour; phosphorothicate; ss

The compositions comprise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding calreticulin. The antisense compound is useful for inhibiting the expression of calreticulin in human cells or tissues. It is also useful for treating a human having a disease or condition associated with calreticulin, e.g., hyperproliferative disorder e.g. cancer, autoimmune disease, viral infection or cardiovascular disease, by inhibiting expression of calreticulin. It is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an antisense compound targetted to human calreticulin. This sequence is used to study the antisense inhibition of calreticulin expression-phosphorothioate 2'-MOE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      30-OCT-2001; 2001WO-US049045
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            gapmer oligonucleotides

                                                                                                                                                     secondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HTV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying oligonucleotides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 X &
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 2077
ABS74336/c
The invention relates to a purified nucleic acid sequence (referred as CACNA2D2 gene which encodes human calcium channel alpha2delta-2 subunit protein) comprising a fully defined alpha2delta splice isoform 1, 2 or 3 nucleic acid sequence, or its complement and the encoded proteins. Also include are: (1) a method of producing a calcium channel protein which involves introducing a recombinant expression vector comprising the CACNA2D2 nucleic acids and encoding the calcium channel protein, into a cultured host cell under conditions such that the host cell expresses the amino acid sequences; and (2) a method for co-expressing calcium channel proteins, comprising carrying out the method of (1), but with one or more than one expression vector comprising one or more nucleic acid sequences encoding the splice variants. CACNA2D2 nucleic acid is useful for producing a calcium channel protein. The recombinantly expressed collypeptide is useful for treating patients with Lambert-Baton myasthenic syndrome (LEMS) (an autoimmune disease) and for identifying compounds useful for treating other diseases associated with abnormal calcium channel protein activity (e.g. epilepsy, migraine, episodic ataxia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Local Similarity

Example 15; New antisense preventing or

Col 41; 46pp; English.

compound useful for inhibiting expression of Talin and delaying infection, inflammation or tumor formation.

for

The present invention describes an antisense compound (1), 16 to 30 bases (1) in length targeted to specific base regions of a nucleic acid encoding (2) human Talin. Also described: (a) an antisense compound up to 30 bases in (2) length which inhibits the expression of human Talin; (b) a composition (II) comprising (I) or (a); and (c) inhibiting the expression of human C Talin in human cells or tissues comprising contacting the cells or tissues in vitro with (I) or (a). (I) has antimicrobial, antihilammatory and cytostatic activities, and can be used in antisense gene therapy and (2 as a Talin expression inhibitor. (I) can be used: to inhibit the expression of human Talin in human cells or tissues; to prevent or delay infection, inflammation or tunour formation; and in diagnostics, continued the prophylaxis, and in research reagents and kits. The present configuration expressions and human Talin antisense chimeric phosphorothicate (2) information and in research reagents and kits. The present configuration antisense chimeric phosphorothicate (2) information and in research reagents and kits. The present configuration and in antisense chimeric phosphorothicate (2) information and in antisense chimeric phosphorothicate (3) in the 5' and 3' ends and a 10 nucleotide decoxy gap in the middle, which is used in an example from the present invention

The present invention relates to a new antisense compound 8-30 nucleobases in length targeted to the start codon, coding region, stop codon or 3'-untranslated region of a nucleic acid molecule encoding human checkpoint kinase 2 (CHK2). The antisense compound specifically hybridises with and inhibits the expression of human CHK2. The antisense compounds are useful for modulating the expression of CHK2 and for treating diseases or conditions associated with expression of CHK2. The antisense compounds are also useful as research reagents and diagnostics, and in distinguishing between functions of various members of a biological pathway. The present nucleic acid sequence represents a chimeric phosphorothicate oligonucleotide that was used in the methods of the invention for inhibition of CHK2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to DNA encoding a guanosine triphosphate binding protein coupled receptor (GPCR) protein (BG37). The GPCR BG37 protein is antirheumatic, antiarthritic, antiulcer, antiinflammatory, antiasthmatic, antiallergic, immunosuppressive and cardiant in its action. The protein is used in the prevention, treatment and diagnosis of diseases associated with GPCR signal transduction, such as rheumatoid arthritis, stomach ulcer, inflammatory bowel disease, ischeamic heart disease, cardiac arrhythmia, hypertension, hypotension, obesity, asthma, allergies, pain and autoimmune diseases. The present sequence represents a primer related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotides targeted to a nucleic acid encoding checkpoint kinase 2 (CHK2), useful for treating a disease or condition associated with CHK2, or in diagnostic and research applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 4 A; 6 C; 6 G; 4 T; 0 U; 0 Other;

for modulating the expression of BCAS1 (breast cancer amplified sequence CC 1, also known as AIBC1 for amplified in breast cancer amplified sequence CC invention are useful for treating an animal having a disease or condition associated with BCAS1, such as hyperproliferative disorders including CC breast or prostate cancer. These compounds are also used as research CC reagents and diagnostice; to distinguish between functions of various CC disorder, which can be treated by modulating the expression of BCAS1; as CC prophylaxis, e.g. to proven or delay infection, inflammation or tumour CC formation; and as probes or primers. These antisense compounds are used in antisense therapy. The present sequence is an antisense compound con the exemplification of the invention by the exemption or tumour the exemplification of the invention of the sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a compound (1) 8-50 nucleobases in length CC targeted to a nucleic acid molecule (II) encoding RAIDD which is an CC adaptor molecule containing both death domain (DD) and caspase crecruitment domains (CARD), where (1) specifically hybridises with and CC inhibits expression of RAIDD, or specifically hybridises with at least an CC 8-nucleobase portion of an active site on (II). (I) is useful for CC inhibiting the expression of RAIDD (Receptor interacting protein (RIP) CC associated ICH-1/CED-3-homologous protein with death domain) in cells or CC tissues, and for treating an animal having a disease or condition CC associated with RAIDD, where the disease or condition is a CC disorder. (I) is also useful for disposetics, therapeutics, prophylaxis, CC disorder reagents and kits, for disposetics, therapeutics, prophylaxis, CC as research reagents and kits, for disposetics, therapeuticn, prophylaxis, CC as cell prophylactical pathway, and in antisense gene therapy. (I) is also useful prophylactically, e.g. to prevent or delay infection, CC inflammation or tumour formation. This sequence represents a mouse RAIDD recein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

     The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule (II) encoding a natural dominant negative regulator of caspase 8, FLIP-c, where (I) specifically hybridises with and inhibits expression of the protein, or specifically hybridises with at least an 8-nucleobase portion of an active site on (II). (I) has antiinflammatory and anti-tumour activities. (I) is an inhibitor of FLIP-c expression, a modulator of apoptosis and can be used in antisense gene therapy. (I) is useful for inhibiting the expression of FLIP-c in cells or tissues, and for treating an animal having a disease or condition associated with FLIP-c. (I) is also useful for modulating apoptosis in a cell, where a caspase such as caspase 8, caspase 3 or caspase 7 is activated, and the FLIP-c is the long form of FLIP-c. (I) is
                                                                                                                                                                                                                                                                                                                                                                                                                                  encoding a macu-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequences, single nucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       also useful for diagnostics, therapeutics, prophylaxis, as research reagents and kits, for distinguishing functions of various members of a biological pathway, and in antisense gene therapy. (I) is also useful prophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence represents human FLIP-c inhibiting chimeric phosphorothicate oligonucleotide having 2'-methoxyethyl (2'-MOE) wings, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; BCAS1; breast amplified in breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patent discloses novel human diacylglycerol kinase (DGK) isoforms namely diacylglycerol kinase epsilon, diacylglycerol kinase zeta, diacylglycerol kinase zeta-2 and their corresponding cDNAs. Human diacylglycerol kinase DNA is useful for coding human diacylglycerol kinase bax is useful for coding human diacylglycerol kinase, which is useful for catalysing the conversion of diacylglycerol kinase, which is useful for catalysing the conversion of diacylglycerol to phosphatidic acid. In particular, the human diacylglycerol kinase and its DNA are useful for decreasing intracellular levels of diacylglycerol (DAG) and for increasing intracellular levels of phosphatidic acid in cells. The present DNA sequence is the exon/intron junction sequence of human diacylglycerol kinase (DGK) zeta gene
                                                                                                                                     New DNAs of the human diacylglycerol kinase, useful for modulating the levels of diacylglycerol kinase in cells to catalyze the conversion of diacylglycerol to phosphatidic acid, therefore increasing phosphatidic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   멂
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
              The invention relates to corneodesmosin protein (I) and nucleic acid (II) cencoding the corneodesmosin gene, where the gene comprises a base substitution, deletion or insertion at one or more positions. (I) and (II) are useful for screening for agents for use in prognosis, diagnosis and treatment of individuals having or being susceptible to corneodesmosin-mediated disease, by monitoring the reaction between the molecules and the agents. The nucleotide and amino acid polymorphisms are useful for diagnosing or determining susceptible to corneodesmosin-mediated disease, which facilitates subsequent treatment of the disease for e.g. inflammatory diseases, in particular psoriasis. Fragments of (I) are useful in diagnostic, prognostic or therapeutic methods and as creening tools for e.g. in drug screening. (II) is useful as probes or primers for detecting an allele of the polymorphism or in the regulation of corneodesmosin gene. Antibodies which binds to (I) are useful for susceptible to consider the polymorphism or in the regulation of corneodesmosin gene. Antibodies which binds to (I) are useful for susceptible to consider the polymorphism or in the regulation of corneodesmosin gene. Antibodies which binds to (I) are useful for susceptible to consider the polymorphism or in the regulation of corneodesmosin gene. Antibodies which binds to (I) are useful for susceptible to consider the polymorphism or in the resulting the antigen. (II) is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC a population with epidermal stem cells from a population of cells without CC epidermal stem cells from the epidermal stem cells from the proparation of cells without CC of epidermal stem cells from the epidermal stem cell population. Isolated CC epidermal stem cells are useful for preparing a tissue in vitro which CC i.e. a connective tissue) so as to yield a tissue in vitro which CC i.e. a connective tissue) so as to yield a tissue. Transformed epidermal CC stem cells are also useful for expressing an open reading frame in a CC mammal which involves contacting a mammal with the cells and detecting or CC determining whether the mammal expresses the open reading frame. Isolated CC cells and transformed cells are also useful for: (1) preparing a chimeric class and transformed cells are also useful for: (1) preparing a chimeric conn-human mammal involving introduction of stem cells into a non-cc mammalian blastocyst forming a chimeric blastocyst which is then introduced into a female non-human mammal capable of gestating a chimeric considermal stem cells transduced with vascular endothelial growth factor (VEGF) may be introduced into diabetic mammals to inhibit or treat CC ischaemia. The methods provide a substantially pure preparation of stem CC capacity, tissue regeneration and long term expression of a transduced consolver gene therapy as these cells have low immunogenicity. This sequence CC represents PCR primer #3 required for the detection of Enhanced green CC in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to 5-hydroxy tryptamine receptor 1A (HTR1A) gene. HTR1A-encoding polynucleotides containing one or more of the novel polymorphic sites are useful in studying the expression and biological function of HTR1A, as well as in developing drugs targeting this protein. In addition, information on the combinations of polymorphisms in the HTR1A gene may have diagnostic and forensic applications. A polymorphic variant of HTR1A is useful in studying the effect of the variation on the biological activity of HTR1A as well as studying the binding affinity of candidate drugs targeting HTR1A for the treatment of neuropsychiatric diseases and Tourette's syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 20 BP; 5 A; 5 C; 8 G; 2 T; 0 U;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a transgenic organism comprising a Plderived artificial chromosome (PAC) vector, which in turn comprises a pituitary adenylate cyclase-activating polypeptide (PACAP) receptor (PACR) gene. The present sequence is a PCR primer for human PACAP type 1 receptor (PAC 1R). PACAP is a neuropeptide which is widely expressed in the brain, and in various peripheral organs. PAC 1R is selective for PACAP and is expressed at high levels in the brain. PAC IR is useful for preparing a medicament in the treatment and/or modulation of disturbances in stroke and other cerebrovascular diseases, cardiovascular diseases, leishmaniasis, immunosuppressive disorders, nociception (reaction to pain sensation) and learning and memory functions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present PCR primer was used to amplify a cDNA fragment encoding a KKIF-1 protein. KLIF-1 is present on the surface of lymphoid progenitor cells and natural killer (NK) cells with an apparent molecular weight of 36-38 kilo Daltons (kD). KLIF-1 is a specific marker for NK cells and lymphoid progenitors. It is used to raise specific antibodies (and fragments of its extracellular domain are used for detecting NK cells. The antibodies are used to remove KLIF-1+ cells from hematopoistic tissue intended for transplantation; to detect, quantify or isolate NK and lymphoid progenitor cells; and to treat autoimmune diseases. Detection of KLIF-1 nucleic acids is used to disease malignant and benign hemopathy. Treatment of hematopoietic cells to remove KLIF-1 positive cells reduces the risk of causing graft versus host disease after transplantation

                                                                                                                     Bronchitis (CB), Bronchiectasis (BE), asthma and Cystic Fibrosis (CF). In addition, patients suffering from mucociliary dysfunction are susceptible to secondary becterial infections. A partial coding sequence for human placental bikunin, AAR35464, has been isolated (see AAA70385). Placental bikunin is a Kunitz-type serine protease inhibitor protein, which can stimulate the rate of mucociliary clearance of mucus and sputum in lung airways. Therefore, placental bikunin protein may be used for treating lung diseases such as CF, CB, BE, and chronic sinusitis and glue ear which are caused by retention and accumulation of mucus. The present sequence is a PCR primer used to clone the extracellular region coding sequence of human placental bikunin
                                                                                                                                                                                                                                                                                                                                                                                                         Mucociliary dysfunction is the inability of ciliated epithelium to cle mucus and sputum in lung airways. Mucociliary dysfunction is a serious complication of chronic obstructive lung diseases such as Chronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Stimulating mucociliary clearance rate of mucus and sputum in lung airways for treating lung diseases such as cystic fibrosis and bronchitis involves administering a Kunitz-type serine protease inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hall
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the presence of Candida in a sample, to detect and disrupt genes, a assign functions to nucleotide sequences. Sequences AAA57968-A57981 represent motifs within the C. albicans genome into which a TCa2 retrotransposon was able to insert

                                                                                                                         The present invention relates to a method for detecting polymorphisms in a nucleic acid sequence. The method comprises amplifying nucleic acid sequences with a first primer homologous to a miniature inverted-repeat transposable element (MITE) in combination with another primer (non)homologous to MITE, separating the amplified nucleic acid fragments, and analysing the fragments obtained in relation to reference fragments obtained from the amplification of the nucleic acid with the primer homologous to MITE. The present sequence is a primer used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer; polymorphism detection; MITE; miniature inverted-repeat transposabl

                                                               The present sequence is one of a large number of antisense oligonucleotides which are targeted to nucleic acids encoding fra-1. The sequences may be oligodeoxyribonucleotides or chimeric oligonucleotides containing a central gap region consisting of ten 2'-deoxynucleotides, which is flanked on both sides by 2'-methoxyethyl (2'-MOE) wings. The oligonucleotides have a phosphorothioate backbone and the cyridine residues in the 2'-MOE wings are 5-methylcytidines. The fra-1 in the cyrides are useful for inhibiting the expression of fra-1 in human cells or tissues. They can be used for diagnostics, therapeutics, prophylaxis and as research reagents and in kits. Use of the antisense compounds may also be useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antisense compound 8-30 nucleobases in length targeted to human -1 and which specifically hybridizes with and inhibits the expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 3;

CC albicans which have a copy number of 40-150, preferably 50-100 copies per CC genome. In particular, the invention relates to the novel C. albicans CC Tyl/copia retrotransposon, designated TCa2, and to the integrated form of CC this retrotransposon, designated TCa2, and to the novel C. albicans CC hCG1042 and has a copy number of 50-100 copies per cell. It comprises CC identical 280 bp long terminal repeats (LTRs) and two open reading frames CC (ORFs). The first ORF encodes a gag (group antigen) protein, and the CC second ORF encodes a polyprotein (pol) consisting of an aspartate CC protease, integrase, reverse transcriptase (RT) and RNaseH. The gag and CC pol ORFs of pCal are in the same reading frame, separated only by a termination codon (TGA). Translation of the stop codon, which is mediated by the formation of a pseudoknot within the gag-pol mRNA. The CC cretrotransposons of the invention can be used as vectors for in vitro or in vivo transformation and expression. They can thus be used for the CC inmunological response in a host organism. They are therefore useful in genetic vaccine compositions and for gene therapy, particularly where the CC retrotransposons may be used to generate transgenic animals, the test of retroviral vectors is unsafe or undesirable. Additionally, the test of the content o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes reprizatory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human fetal brain cDNA clone vc4_1 DNA probe.

cDNA libraries.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the

The CC polynucleotides and proteins are predicted to have biological activities CC which would make them suitable for treating, preventing or ameliorating CC medical conditions in humans and animals, although no supporting data is CC given. Suggested activities include nutritional activity, cytokine and CC cell proliferation/differentiation activity, immune stimulating (e.g. as CC tissue growth activity, activity, hemostatic and thrombolytic activity, chemostatic and thrombolytic activity, creceptor/ligand activity, anti-inflammatory activity, cadherin/tumor CC invasion suppressor activity, and tumor inhibition activity. The CC creceptor/ligand activity, anti-inflammatory activity activity. The CC invasion suppressor activity, and tumor inhibition activity. ANZ43809-CC 243840 represent DNA probes used to isolate the polynucleotides control of the contr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                               AAV73084-V73145 are oligomers used in a method to detect a single-base mutation in a human ras oncogene. These probes comprise 12-43 nucleotides of formula 5'-B-Q-D-3', Q = 3 nucleotides complementary to the mutated codon, and B and D each = 0-20 nucleotides complementary to the ras sequences flanking the mutated codon. The probes are useful for detecting cancers associated with point mutations
        Human ras oncogene probe #6

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAV73026-V73071 are probes used to detect a single-base mutation in a human ras oncogene. These probes comprise 12-43 nucleotides of formula 5' -B-Q-D-3', Q=3 nucleotides complementary to the mutated codon, and B and D each = 0-20 nucleotides complementary to the ras sequences flanking and D each = 0-20 nucleotides complementary to the ras sequences flanking the mutated codon. The probes are useful for detecting cancers associated with motion of the probes are useful for detecting cancers associated with motion of the probes are useful for detecting cancers associated with motion of the probes are useful for detecting cancers associated with motion of the probes are useful for detecting cancers associated with motion of the probes are useful for detecting cancers associated with the probes are useful for detecting cancers associated with the probes are useful for detecting cancers associated with the probes are useful for detecting cancers associated with the probes are useful for detecting cancers associated with the probes are useful for detecting cancers associated with the probes are useful for detecting cancers associated with the probes are useful for detecting cancers associated with the probes are useful for detecting cancers associated with the probes are useful for detecting cancers associated with the problem of the prob
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Probes for detecting ras oncogene point mutations - useful for diagnosis of cancer associated with single base mutations.

                                                                                                                                                                                           acids targets; and for analysis of nucleic acid structures. The methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or alleles of mammalian genes associated with disease and cancers, and the identification of the source of nucleic acids found in forensic samples, as well as in paternity determinations. The methods allow simultaneous analysis of both strands (e.g. the sense and antisense strands) and are ideal for high-level multiplexing. The products produced are amenable to qualitative, quantitative and positional analysis. The methods may be performed in solution or in the solid phase (e.g. on a solid support). The methods are powerful in that they allow for analysis of longer fragments of nucleic acid than current methodologies. Sequences AAV70430-31 represent primers used for the PCR amplification of M. tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       characterisation of nucleic acid sequences and sequence changes. One method of detection and characterisation comprises: (a) providing: (i) a folded target having a DNA sequence comprising at least 1 double stranded region and at least 1 single stranded region; and (ii) at least 1 probe complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe folded target complex. Also provided are methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic methods for determination of the folded targets and the structure formation in nucleic acid targets; for analysing folded nucleic methods for determination of the folded targets and the structure formation of the folded nucleic acid targets; for analysing folded nucleic methods for determination of the folded nucleic methods for determinati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection and characterisation of nucleic acid sequences - be folded target and one or more probes to form a probe/folded complex and detecting and characterising the complexes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            M. tuberculosis katG gene primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAV70431 standard; DNA;

                                                                                      CC to growth factor plasma membrane receptors (including insulin receptors)
CC and signaling motifs in signaling proteins and modulates the activity of
Ct those molecules through tyrosine kinase activity. It is also associated
CC with vesicle trafficking and protein sorting and therefore acts as a
CC mediator of insulin action on glucose transport and metabolism. The
CC specification describes a mutated P85-alpha nucleic acid sequence which
CC comprises the mutations, relative to the present sequence: C261T, T663G,
CC A810G, and/or G1020A. The nucleic acids may be used to detect mutated
CC genes encoding the P85 alpha subunit of P13K and to identify mutations
CC which may alter the activity of the polypeptide and result in a disease
CC state. P13K is associated with pinocytic activity, cytoskeletal
CC rearrangements that accompany secretory processes, membrane ruffling,
CC actin reorganization in KB cells in response to insulin, protein sorting
CC and in membrane and vesicle trafficking. Therefore, P13K acts as a
CC mediator of insulin action on glucose transport and metabolism. Mutations
CC in the P13K gene result in decreased glucose disappearance rates,
CC consequently, mutations in P13K genes are associated with glucose
CC resistance or (impaired glucose tolerance), non-insulin dependent
CC chaetes mellitus (NIDDM), cardiovascular disease, obesity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Regulatory p85-alpha subunit; human; phosphatidylinositol 3-kinase; P13K; growth factor plasma membrane receptor; insulin receptor; tyrosine kinase activity; vesicle trafficking; protein sorting; pinocytic activity; cytoskeletal rearrangement; membrane ruffling; actin reorganization; insulin; glucose disappearance rate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     actin reorganization; insulin; glucose disappearance rate; glucose sensitivity; glucose resistance; glucose tolerance; non-insulin dependent diabetes mellitus; cardiovascular disease; obesity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                      The present sequence is a DNA primer used for PCR amplification to detect the regulatory p85-alpha subunit of phosphatidylinosicol 3 kinase (PI3K) amino acid substitution at codon 326, preferably Met326Ile, by SSCP gel analysis. A nucleic acid sequence encoding a regulatory subunit of PI3K, and comprising at least 1 mutated nucleotide, can be used as a diagnostic tool, marker or probe. The presence of a mutation in a gene encoding a regulatory subunit of PI3K can be detected by analysing a biological sample for the above nucleic acid sequence, useful to determine predisposition to impaired glucose tolerance (particularly when related to reduced glucose disappearance constant), or decreased glucose efficiency or insulin sensitivity (all of which may develop into non-insulin dependent diabetes, cardiovascular disease, obesity or
                                                                                                                                                                                                                                                                                                                                              Mutant phosphatidyl:inositol 3 kinase regulatory subunit DNA - useful to detect predisposition to impaired glucose tolerance and reduced insulin sensitivity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC criteria. Also claimed are methods for gene-silencing, developing an CC siRNA algorithm for selecting siRNA, selecting an siRNA with improved cf functionality, selecting hyperfunctional siRNA, an siRNA molecule cffective at silencing Bcl-2, and a kit for gene silencing comprising the siRNA. The siRNA molecule comprises a sequence substantially similar to a C sequence consisting of GGAGAUAGUGAUGAGUA; GAAGUACCUCUAGUUU; GUACGACACCGGAGAUA; AGAUAGUGAUGAAGUA; GAAGACUCUCUCUCAGUUU; CC CAUGCGGCCUCUGUUUGA; UGCGGCCUCUGUUUGAUUA, GAAGACUCUCUGUCUCAGUUU; GAGAUAGUACA; CC CAUGCGGCCUCUGUUUGA; UGCGGCCUCUGUUUGAUUU; GAGAUAGUAGUACA; CC CAUGCGGCCUCUGUUUGAUGAUGAUUU; GAGAUAGUAGUACA; CC COMPRISES a sense strand and an anti-sense strand. The siRNA molecule comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a hairpin. The siRNA molecule comprises a hairpin and an anti-sense strand. The siRNA molecule comprises a hairpin and an anti-sense strand. The siRNA molecule comprises a between 18 and 30 base comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a strand and an anti-sense strand. The siRNA molecule comprises at sense strand and an anti-sense strand. The siRNA molecule comprises a strand and an anti-sense strand. The siRNA molecule comprises at sense strand and an anti-sense strand and an anti-sense strand and an anti-sense strand and an anti-sense strand and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
```

The sequence is that of a probe based on a unique nucleic acid sequence in the Chlamydia trachomatis major outer membrane protein (MOMP) gene which is present in all 15 serotypes of C. trachomatis. It corresponds to nucleotides 747-766 of the MOMP gene. It may be used for detecting and/or amplifying the MOMP gene of C. trachomatis, and can detect all 15 serotypes of C. trachomatis. Since the MOMP gene is unique for C. serotypes of C. trachomatis. Since the MOMP gene is unique for C. trachomatis, there will be no cross-hybridisation to nucleic acid from trachomatis, there will be no cross-hybridisation to nucleic acid from

CC The invention relates to a novel isolated small interfering RNA (sirNA) CC polynucleotide, comprising at least one nucleotide sequence from any of the 20 fully defined sequences given in the specification. The invention CC further relates to: a pharmaceutical composition comprising a new sirNA, comprising a polynucleotide that is capable of directing transcription of an sirNA; a host cell transformed or transfected with the above recombinant nucleic acid construct; a method for interfering composition of a protein tyrosine phosphatase (PTP)1B polypeptide, or its variant; a method for identifying a component of a PTP1B signal cransduction pathway; a method for modulating an insulin receptor protein phosphorylation state in a cell; and a method for altering a Jak2-cc antidiabetic, anorectic, antinflammatory, neuroprotective, cytostatic, cimmunosuppressive, and antimicrobial. The novel siRNA polynucleotides can be used in gene therapy to treat disorders. The composition and methods cransduction, such as diabetes, obsestly, hyperglycaemia-induced composition, such as diabetes, obsestly, hyperglycaemia-induced composition. This polynucleotide sequence represents an siRNA composition of the invention of the invention of a protein tyrosine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New small interfering polynucleotide that modulates protein tyrosine phosphatase (PTP)1B polypeptide signal transduction, useful for treating disorders associated with altered PTP1B signal transduction, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ADO14633 standard; RNA; 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 19

                                                                                                                                                                                       Specifically, the sinks include short interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonnucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siRNA; conjugates and/or complexes of siRNA; and vectors that express siNA. The siNAs are used to modulate expression of the PDGFr gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating leukaemia and solid tumours, restenosis, polycystic kidney disease, bronchiolitis, glomerulonephritis and stroke. The siNas are also useful for drug screening, diagnosis, therapeutic target identification and validation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to short interfering nucleic acids (sIMA) which downregulate expression of the human platelet-derived growth factor receptor (PDGFr) gene by RNA interference. The siMAs may or may not comprise ribonucleotides and may be double or single stranded. They

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine laukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering,
                                                                                                                                                                                                                                      20-FEB-2003;

                                                                                                                              The invention relates to a novel double-stranded short intertering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cycostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                   New
                                                                                                               Sequence

The invention also relates to kits for the in vitro or in synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the EZH2 gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human EZH2 targeted double stranded siNA, which is identical to the EZH2 transcript target

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New double-stranded interfering nucleic acid, useful e.g. and diagnosis of leukemia and lymphoma, downregulates the cluster region-Abelson (BCR-ABL) gene.
                                                                                                                             short interfering nucleic acid; siNA; breakpoint cluster regreshl Abelson murine leukaemia viral oncogene homologue 1; Bucytostatic; leukaemia; lymphoma; human; ss; siRNA; ABL1.

cexpressed from a vector or enzymatically synthesised. The invention also
celates to kits for the in vitro or in vivo delivery of siNA; conjugates
and/or complexes of siNA; and vectors that express siNA. The siNAs are
cused to modulate expression of the telomerase genes in cells, tissue
explants or organisms (e.g., by ex vivo gene therapy), or in grafts and
cexplants for the treatment of a variety of conditions. They may be
cused for treating cancer, restenosis, infectious diseases (specifically
cused for treating cancer, or autoimmune or age-related diseases,
ce.g. multiple sclerosis, lupus exythematosus, AIDS, macular degeneration,
ce skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug
screening, diagnosis, therapeutic target identification and validation,
centric engineering, pharmacogenomics, studying gene function, and gene
mapping (e.g., of single nucleotide polymorphisms). The present sequence
represents the lower strand of a human TERT-targeted double-stranded

The siNAs may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA) double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enventional to contain deoxyribonucleotides, and can be chemically synthesised.

cc include short interfering RNA (sirNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be compared to the sinas can be unmodified or chemically synthesised, expressed from a vector or enzymatically continued to the sinas to kits for the in vitro or in contained. The invention also relates to kits for the in vitro or in continued to the sinas are used to modulate expression of the EZH2 gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer. The sinas are also cuseful for drug screening, diagnosis, therapeutic target identification and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human EZH2 targeted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            11-MAR-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC deoxyribonucleotides, and can be chemically synthesised, expressed from a CC vector or enzymatically synthesised. The invention also relates to kits CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes CC of siNA; and vectors that express siNA. The siNAs are used to modulate CC expression of the IGF-IR gene in cells, tissue explants or organisms CC (e.g., by ex vivo gene therapy), or in grafts and transplants for the CC treatment of a variety of conditions. They may be used for treating CC kidney disease, inflammatory and/or allergic diseases, autoimmune CC diseases and transplant rejection. The siNAs are also useful for drug creening, diagnosis, therapeutic target identification and validation, CC genetic engineering, bharmacogenomics, studying gene function, and gene CC mapping (e.g., of single nucleotide polymorphisms). The present sequence CC represents the upper strand of a human IGF-IR targeted double-stranded CC siNA, which is identical to the IGF-IR transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
